TITLE: Improving the Adhesive Properties of FAISOL Coatings

SOURCE: Stroitel'nyye Materialy, No 10, 1966, p 34

TOPIC TAGS: protective coating, adhesive, metal coating

ABSTRACT: In an effort to improve the adhesive qualities of the anti-corrosion coating for concrete and metal, called FAIZOL (FAISOL), which is a mixture of furfural acetone monomer with sand or other mineral additives plus benzosulfonic acid hardener, the Ukrainian Scientific-Research Institute of Plastics added maleic anhydride equal to 15-20 percent the weight of the resin in the form of an acetone solution of about a 30-percent concentration. It was heated for two hours at 130 deg C and then blended with the mineral additive for 3-5 minutes. The filler used was finely pulverized argillite in the quantity 150 parts by weight to 100 parts by weight of the resin. The composition was found to be satisfactory for coating horizontal surfaces. Protection for vertical surfaces necessitated the addition of 250 parts by weight of argillite and additional heating of the mixture for three hours. The adhesive properties were considered satisfactory (shear strength of two slabs joined with the mixture was over 2 kg/cm²). The heat resistance was 100° C. Since the mixture, FAISOL, with its new composition was found to be vulnerable to the effects of ultraviolet light, it is recommended that it be used only to protect the surfaces of underground concrete and metal structures or pipes. Collection of Physics and Mathematics; Ya. Kh. Turakulov, Doctor of Biological Sciences. Ed.: R. I. Khamidov; Tech. Ed.: A. G. Bulkinova.

PURPOSE . The publication is intended for scientific workers and specialists employed in enterprises where radioactive isotopes and nuclear radiation are used for research in chemical, geological, and technological fields.

CONTENTS: This collection of 153 articles represents the second volume of the Transactions of the Tashkent Conference on the Peaceful Uses of Atomic Energy. The individual articles deal with a wide range of problems in the field of nuclear radiation, including: production and chemical analysis of radioactive isotopes; investigation of the kinetics of chemical reactions by means of isotopes; application of spectral analysis for the manufacturing of radioactive preparations; radioactive methods for determining the content of elements in the rocks; and an analysis of methods for obtaining pure substances. Certain

TITLE:

A recording dynamometer for the study of relaxation processes in polymer materials

PERIODICAL:

Kauchuk i rezina, no. 2, 1962, 37 - 39

TEXT:

A recording dynamometer for investigating slow relaxation processes has been designed, permitting the process to take place in various gaseous media and within a large temperature range. Determination of the relaxation rate of tension is recommended as a method for evaluating the type of inter-molecular vulcanization bonds, the stability of the vulcanizates during the thermo-mechanical actions and fatigue, as well as the effectiveness of the anti-aging and anti-fatigue agents. Disadvantages of previously existing instruments are pointed out as being of low sensitivity, or even dangerous due to the mercury used. The recommended instrument (Fig. 1) does not require the presence of the operator. Its circuit diagram is given in Figure 2. The bridge is fed by a stable tension of D.C. from the accumulator battery B through the rheostat R7, intended for regulating the working current and with this, the measuring range and sensitivity

TITLE: Effect of thio-derivatives of amines and phenols in the process of thermo-mechanical treatment and fatigue of vulcanizates

SOURCE: Vy*sokomolekulyarny*ye soyedineniya, v. 5, no. 6, 1963, 892-899

TOPIC TAGS: vulcanizates, fatigue of vulcanizates, thermomechanical treatment, thio-derivatives of amines, thio-derivatives of phenols, rate of oxygen uptake, hydroperoxides, synergistic effect

ABSTRACT: Earlier publications by the authors demonstrated that thermomechanical stresses cause a breakdown and regrouping of the vulcanization network in vulcanizates, the ultimate sheer modulus depending on the course of the regrouping processes. Since similar phenomena are taking place also in thermo-oxidative processes, where a key role belongs to the free radicals, it was logical to assume that the properties of vulcanizates would be influenced by substances capable of controlling the oxidations and the free radicals as well. To this end, thio-derivatives of amines and phenols were chosen, and their effect on the decomposition

7

of cumenehydroperoxide and on the kinetics of oxygen uptake by rubber studied, using the electron para-magnetic resonance technique. It was found that in the presence of 0.02 Mol of thioldiphenylamine per 1 Mol of peroxide it takes 90 minutes for its complete decomposition, as against 30 minutes with diphenylamine and 20 minutes without an inhibitor. The addition of 0.5 Millimol of the same amines to 100 gm rubber at 130C showed within one hour a barely noticeable oxygen uptake in the presence of thioldiphenylamine, as against 400 ml/gm for diphenylamine, while the control reached the latter figure within 30 minutes. The thio-derivatives of amines and phenols also showed a much more pronounced effect on the rate of chemical relaxation and a higher fatigue resistance of the vulcanizates as compared with the corresponding amines. An additional advantage of the thio-derivatives is their synergistic effect. It is concluded that the thio-derivatives of amines are more effective, as compared to the amines, in the preservation of the original vulcanization network in the processes of thermo-oxidative and thermomechanical influences. It is mentioned in footnotes that measurements by the electron paramagnetic resonance technique were obtained by Kashlinskaya, A. I. on an installation OKBA of the Goskhimkomitet, and that the spectrum was taken by Kavun, S. M. on a RE-1301 radio-spectrometer of the Scientific Research Institute of the Tire Industry. Orig. art. has: 1 formula, 7 charts, and 3 tables.

AUTHOR: Snisarenko, A.M.; Tarasova, Z.N.

TITLE: A study of physico-chemical changes in structure during wear of vulcanized rubber

SOURCE: Nauchno-tekhnicheskoye soveshchaniye po friktsionnomu iznosu rezin. Moscow, 1961. Friktsionnyy iznos rezin (Frictional wear of rubber); sbornik statey. Moscow, Izd-vo Khimiya, 1964, 88-94

TOPIC TAGS: natural rubber, vulcanized rubber, rubber wear, rubber structure, frictional wear, vulcanization kinetics, mercaptobenzthiazole, radiation vulcanization, rubber abrasion

ABSTRACT: Experimental methods and a mathematical model were developed which permit the evaluation of the physical and chemical properties of rubber vulcanizates during abrasive wear. The kinetics of the sulfur-natural rubber reaction were studied at 100-130C with sulfur-35 and in the presence or absence of 2-mercaptobenzthiazole. Sulfur and accelerator were also added to irradiation-vulcanized/unfilled natural rubber. The latter was abraded on a Grasselli type tester at 100% slippage against Monokorund 150-abrasive paper or against corrugated rigid polyvinyl chloride. The solvent swelling

Card 1/2

L 40564-65

ACCESSION NR: AT5004098

of abraded particles was measured in Dogadkin's apparatus to evaluate changes in crosslinking, and radiation measurements indicated the bonding of sulfur and the cleavage of mono- and polysulfide bonds during abrasion. A mathematical model was developed correlating the bonding of sulfur and change in rate constants with temperature. The experimental results indicated that the increase in temperature of the contact zone and abraded layer is markedly higher than assumed by earlier theories and little affected by the normal load during wear. The reaction period is on the order of a few seconds, confirming assumptions of fatigue effects in the abrasive wear of vulcanized rubber. The applied load affects wear by the penetration of abrasive particles into the rubber. Differences in the calculated period of chemical processes on different abrasive surfaces are ascribed to the difference in temperatures reached and to the effects of surface properties. Orig. art. has: 2 figures, 3 tables and 7 formulas.

TITLE: A new method for determining the wear of tire treads by means of radioac-
tive compounds

SOURCE: Nauchno-tekhnicheskoye soveshchaniye po friktsionnomu iznosu rezin. Mos-
cow, 1961. Friksionnyy iznos rezin (Frictional wear of rubber); sbornik statey.
Moscow, Izd-vo Khimiya, 1964, 210-215

TOPIC TAGS: rubber wear, frictional wear, rubber abrasion, tire tread, abrasion
testing, radioisotope measurement 19

ABSTRACT: ^{gm} Two methods have been developed at the NII shinnoy promyshlennosti (Tire
industry scientific research institute) to permit exact measurements of the wear of
tire treads under commercial and laboratory conditions, respectively. For measure-
ments under road conditions, a B-ray source, preferably thallium-204, is inserted
into the tire and the intensity of radiation is found to increase with the wear of
the absorbing rubber layer. A metal alloy of Tl-204 is prepared by melting with

Card 1/1

L 40540-65

ACCESSION NR: AT5004106

tin and lead to a concentration of 1 mc/g and solidified in a thin-walled glass capillary to obtain fine wires for inserting into the tire through the needle of a syringe. The error of measurement is negligible if the isotope is not covered by a layer thicker than 1.5 mm of rubber, permitting ± 0.01 mm accuracy. The scattering of data is lower than in measurements with a depth gage, as shown in Fig. 1 of the Enclosure. The second method, designed for wear tests under laboratory conditions, involves the diffusion of sulfur-35 into the tread during vulcanization. A gradient of radioactivity is formed in the tread, permitting automatic recording of wear during testing. The measured surface activity can be linearly correlated with wear by an exponential equation except for a short initial period of wear. Orig. art. has: 4 figures.

TITLE: Boundaries of life

SOURCE: Nauka i tekhnika, no. 10, 1965, 36-39

TOPIC TAGS: anabiosis, microbiology, fungus, bacteria, photosynthesis, interplanetary flight, space biology

ABSTRACT: Microorganisms^{1p} are capable of growing and reproducing under the most varied conditions. Some strains can remain vigorously active in hot springs up to about 85°C; in a state of anabiosis¹, microorganisms can withstand temperature extremes from the frosts of the Arctic and Antarctic to extremely high temperatures. Water is essential to life; mold fungi usually tolerate extreme dryness better than bacteria. Lichens are extremely well adapted to extreme fluctuations of temperature and humidity. Energy sources are varied: in addition to species producing energy by the oxidation of organic substances or utilizing sunlight by photosynthesis, autotrophic bacteria produce energy by oxidizing inorganic substances. The ferrobacteria are especially interesting from the standpoint of space biology. The high resistance of microorganisms¹ to radiation means that they could be transported on spaceships (purposefully or inadvertently) with negligible shielding. If bacteria are transported to other planets, they might rapidly colonize them. The most probable groups of organisms that might contaminate other

2

planets are: spore-bearing bacteria, which live for long periods and are stable to heat; autotrophic bacteria with unusual energy sources; mold fungi resistant to dryness, which require very little nutrition; algae and lichens, which are extremely hardy and varied. The most important factors determining the possibility of multiplication of terrestrial microorganisms on other planets are: temperature from 0°C to 80°C and the presence of moisture on the planet (or formulated as a single requirement: the presence of water in the liquid state). The disinfection of rockets is extremely difficult, but essential for interplanetary flights since a spaceship returning to earth from another planet containing life might bring along with it extraterrestrial organisms against which we would have no means of protection. TITLE: Experimental Investigations of the Working of Riveted Joints of Steel NL1 in Thick Bundles Under Static Loads (Eksperimental'nyye issledovaniya raboty zaklepochnykh soyedineniy iz stali NL1 v tolstykh paketakh pri staticheskoy nagruzke)

PERIODICAL: Tr. Dnepropetr. in-ta inzh. zh. -d. transp., 1956, Nr 25, pp 318-334

ABSTRACT: Tests were performed to verify the properties of assembly-riveted joints of bridge frames performed according to a novel procedure. Each sample consisted of a bundle of seven sheets of various thicknesses, 410 x 200 mm in size, of an overall thickness of 120 mm, held together by ten 23-mm diam NL1-steel rivets. The tests showed that assembly riveting according to the subject procedure ensured, on the average, a 10-15% greater strength than riveting in the shop. Since the actual strength of the joints was 123 to 140% of the specification value, it is concluded that when thick bundles are riveted on the assembly job there is no need to augment the number of rivets by 20% as is required by the 1947 TU (Technical Order, Transl. Ed. Note). S. Ya. Makarov
